

How to check links

Testing links

A key technical testing task is to check all the links in your site. Adobe Dreamweaver CS5 lets you do this automatically by using the Link Checker.

To check links:

1. Start Dreamweaver.
2. Make sure your site is open.
3. On the menu bar, select Site > Check Links Sitewide.

The Link Checker tab displays all the broken links in the site (**Figure 1**).

Note: Even though links are listed as broken, check them in the browser to confirm.

4. Fix the broken links and check the links again.

Note: To clear the current Link Checker results, select Clear Results from the Link Checker Options menu.
